Basic Description:

1. Legs and crossbeam pole are aluminum pipe, held in place with notches. The cross beam pole is also secured using a spring-ball pin and counter-torque bolt on the end.
2. Riser supports provide 4 sets of 3 holes each for each riser on each side so that standard 4-riser set can be used.
3. Each riser is held to the support with a 3 lengths of 16" bungee cord that loops through the riser's quick link and hooks into the riser support. Riser hooks are held in place by drain plugs. That prevents the entire riser assembly from coming apart while in transport or being handled.
